算法思想:在待排序表L[1...n]中任取一个元素pivot作为枢轴(或基准,通常取首元素),通过一趟排序将待排序表划分为独立的两部分L[1...k-1]和L[k+1...n],使得L[1...k-1]中的所有元素小于pivot,L[k+1...n]中的所有元素大于等于pivot,则pivot放在了其最终位置L(k)上,这个过程称为一次"划分"。然后分别递归地对两个子表重复上述过程,直至每部分内只有一个元素或空为止,即所有元素放在了其最终位置上。

知识回顾与重要考点

算法思想:在待排序表L[1...n]中任取一个元素pivot作为枢轴(或基准,通常取首元素),通过一趟排序将待排序表划分为独立的两部分L[1...k-1]和L[k+1...n],使得L[1...k-1]中的所有元素小于pivot,L[k+1...n]中的所有元素大于等于pivot,则pivot放在了其最终位置L(k)上,这个过程称为一次"划分"。然后分别递归地对两个子表重复上述过程,直至每部分内只有一个元素或空为止,即所有元素放在了其最终位置上。

注: 408原题中说,对所有尚未确定最终位置的所有元素进行一遍处理称为"一趟"排序,因此一次"划分"≠一趟排序。 一次划分可以确定一个元素的最终位置,而一趟排序也许可以确定多个元素的最终位置。
